Fotona4D®Men is an innovative form of laser skin resurfacing and rejuvenation tailored specifically for male skin. What makes Fotona4D®Men unique is that Fotona's complementary Er:YAG and Nd:YAG laser wavelengths are synergistically applied in a 4-step procedure using 3 different proprietary modes (FotonaSMOOTH®, PIANO™ and SupErficial™) to produce full-thickness contraction of collagen for persistent tightening and volumization.

Men's skin differs from women's in that it is thicker and has larger pores, more hair, less subcutaneous fat and generates more sweat and sebum. The four protocol steps in the Fotona4D®Men treatment have been designed with laser parameter settings optimized for achieving superior results in male skin:

Step 1 SmoothLiftin™ - intraoral tightening

Step 2 SMOOTH™ Remodeling - rejuvenation & collagen remodeling

Step 3 PIANO™ - deep heating & synergistic tightening

Step 4 SupErficial™ - light peel

110059 CE ENG/1

The unique combination of the three modalities and four treatment steps provides an effective tool to enhance not only the superficial, but also the medial and deeper structures of the male skin in a quick, safe and precise manner.
